Properties of Weathering Steel

- Planters are shipped with rustic mill scale finish. They may begin to rust in transit. Initial rust patina develops within weeks, complete rusting may take years to develop.
- Exact finish and rate of rust patina formation varies greatly based on environmental conditions at the installation location.
- Some environmental conditions will hasten the weathering steel process causing early rust (e.g. salt and/or sub-tropical climate).
- Rust staining will likely occur on any surface the planter is mounted on, as well as any path that rain runoff follows, and any gutter/drain system near the planter. This will lessen over time.
- Exact color of patina will change over time from a vibrant orange to a darker brown color.
